

The allergy treatment
that can work for
MORE of your patients

CircavaSystem
by PotensAllergy

The power and personalized dosing of subcutaneous immunotherapy (SCIT) injections, *in a patient-friendly oral therapy*

Circava System™ therapy is a novel, patented allergy treatment system developed by a board-certified allergist and proven over many years of clinical use. The power of the system's customized serums is unlocked by the body's natural circadian cycle, providing long-lasting relief. Patients have experienced symptom relief in as little as four weeks!

Circava System therapy can be used to treat:

- Allergic asthma
- Bronchial asthma
- Allergic rhinitis, also known as hay fever or “seasonal” allergy
- Allergic conjunctivitis or eye allergies
- Atopic dermatitis (eczema)

The problem with subcutaneous immunotherapy (SCIT) injections

More than 50% of patients receiving SCIT injections quit before completing the therapy.¹

Over **20%-30% discontinued SCIT** because of adverse effects **THAT CAN VARY FROM MILD TO SEVERE.**²

The reasons cited include the **frequency of injections**, the **duration of treatment**, **time required** and **inconvenience.**²

SCIT injections are **contraindicated** for patients with **ACTIVE** autoimmune disease, those taking **beta blockers**, and patients **under five years of age.**

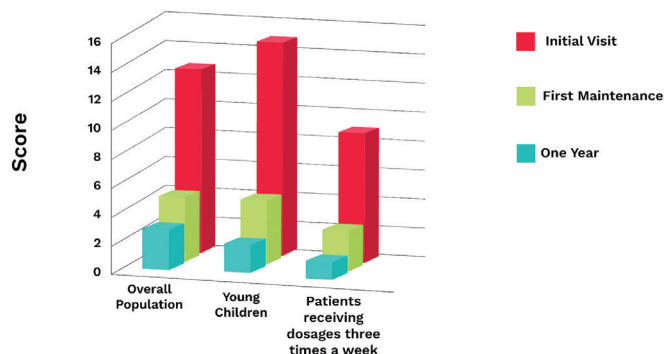

Circava System is the solution for lasting allergy relief

Circava System therapy is an oral immunotherapy treatment backed by data on more than 2,000 allergy patients demonstrating quick results (relief of symptoms is achieved in as little as four weeks) with a faster time to maintenance vs. SCIT³ and no reported severe reactions.

Circava is only available as a physician-prescribed and physician-supervised therapy. Unlike SCIT, it can be prescribed for patients taking beta-blockers, patients with autoimmune disease and pediatric patients as young as 3.5 years old. It may also be a more convenient option for patients with work, travel or other limitations on office visits.

Symptom Relief

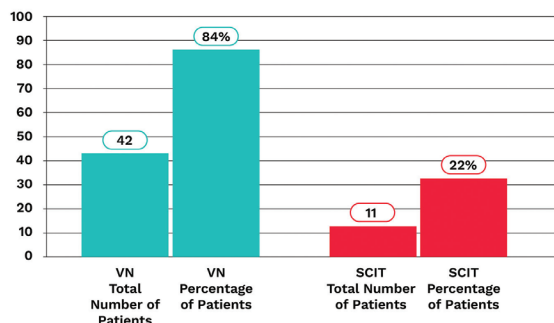

Total Change In Symptom Score In The Overall Population, Young Children, And Patients Receiving Dosages Three Times A Week

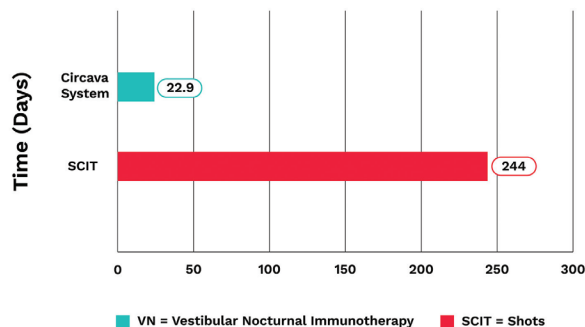

This graph documents the significant impact of Circava System treatment on both adults and children that received treatment for one year, indicating an ample effect on symptom resolution.⁵

Patient Compliance

Total Number And Percentages Of Patients That Reached Maintenance Level Immunotherapy N=100 Patients

Time Necessary To Reach Maintenance Level Of Immunotherapy with SCIT Or Circava System

This data indicates superior compliance with the use of Circava System compared with SCIT, as well as a statistically significant shorter period of time to reach maintenance dosage. This demonstrates that Circava System therapy is a more accessible treatment model to the general population.

Comparable Effectiveness

Comparative effect of SCIT versus Circava System in Symptom Resolution and Functional Parameters in Individuals with Bronchial Asthma

Allergic Rhinitis: Sublingual Immunotherapy vs. Subcutaneous Immunotherapy

These graphs demonstrate a very comparable effectiveness of Circava System therapy versus allergy shots in symptom resolution.

Additional clinical data is available at PotensAllergy.com.

How it works

Circava System's patented protocol is self-administered by the patient within the dendritic-rich oral vestibular space and at night. This novel approach also takes advantage of the changes that take place during the fluctuations of the circadian cycle, when the immune system becomes particularly receptive to the administration of immunotherapy.

How to prescribe Circava System

1. Contact Potens Allergy for provider agreement, training, and support materials.

DIAGNOSIS

2. Conduct a diagnostic skin test. If you are not currently conducting skin testing, Potens Allergy can help you with skin testing materials and in-depth training. If you prefer, or if necessary, the alternative use of an in vitro allergy test from your local laboratory is adequate.

TREATMENT

3. Send in skin testing results, prescription, and payment and we will create personalized serums for your patient at our U.S.-based compounding facility.
4. The patient requires an office visit where they receive instructions from you along with their first two treatment sets. After two weeks, the patient returns to your office for your evaluation, where they pick up the third and fourth (maintenance) treatment sets. Instruct the patient to schedule a follow-up appointment two weeks before needing the next set of drops at 3-month intervals, or more frequently if appropriate.
5. This is a cash-pay service; however, office visits and skin tests are to be billed to insurance if applicable.

Keep your patient within your practice!

According to a recent United Allergy Services survey, more than two-thirds (68%) of allergy sufferers would prefer treatment from their family care doctor than an allergist. Referral to a specialist could cause your patient significant inconvenience and higher out-of-pocket costs for treatment and medications. With Circava System, you treat and maintain your patient, and benefit from a potential new revenue stream.

About Potens Allergy

Potens Allergy was founded with a simple mission: To offer relief to allergy patients who were unable to participate in allergy shot treatment, the current standard for allergy immunotherapy. Whether a patient was prescribed beta blockers, a family didn't have the time to visit the doctor twice a week, or a very young child suffering from allergies, founder and board-certified allergist Dr. Roberto Garcia-Ibáñez knew there had to be a way to help them live a life without allergies.

Following 15 years of clinical observations, Dr. Garcia-Ibáñez discovered and designed Circava System, a ground-breaking allergy treatment that is efficient, fast, and accessible.

This novel approach to allergy immunotherapy can be used to treat general allergies (rhinitis), allergic asthma, and atopic dermatitis. In addition, Circava System can be used to treat recurrent vulvovaginal candidiasis (yeast infection), which is often caused by yeast allergies.
