

# Harness the power of *sleep* to treat pediatric allergies

Treating childhood allergies can be challenging. When your diagnosis calls for immunotherapy, SCIT injections can be both painful and upsetting to children. What's more, injections are typically not recommended for patients under 6 years of age.

## Circava System™ is changing the way pediatric allergies are treated.

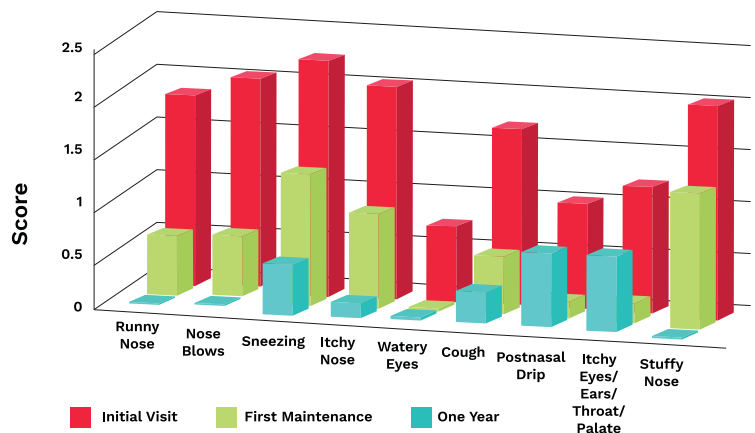

Circava System Therapy is a novel allergy treatment, developed by a practicing allergist, that can work for more of your patients. It offers comparable effectiveness with allergy shots, but in a fast-acting and more child-friendly oral dose that your patients' parents can administer at bedtime. It takes advantage of the changes in the immune system during the body's natural circadian cycle to achieve results in as little as 4 weeks!

Unlike SCIT, patients as young as 3.5 years of age can benefit from this therapy. No physician supervision is required after the first treatment dosage. Best of all, you can keep your patient within your practice, without needing to refer them to an allergy specialist.

**84.6% of improvement of individual domains of symptom score in children ages 3.5 to 5 years after one year of maintenance dosage<sup>1</sup> of Circava System Therapy.**

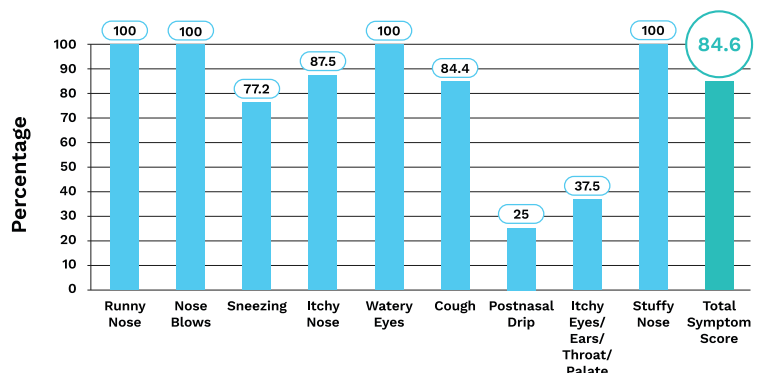

## RAPID SYMPTOM RESOLUTION

Average overall symptom score from initial visit to one year in children under 4 years of age

## LASTING RELIEF

Average categorical symptom score in children 3.5-5 years after one year

To more fully evaluate how Circava compares to SCIT, please review the clinical data available in the "For Providers" section of our website at PotensAllergy.com. Prescribing Circava System Therapy is easy! Circava System is only available as a physician-prescribed and supervised therapy. Your patient will need an allergy skin test to order the serum. We will be able to assist with training and set-up of skin testing for your practice.
